

JOBSHEET PRAKTIKUM

Mata Kuliah: Pemrograman Web Lanjut

Pertemuan 6 – Implementasi Form Validation pada Filament

Capaian Pembelajaran

Setelah mengikuti praktikum ini, mahasiswa mampu:

1. Menerapkan validasi form pada Filament
2. Menggunakan method `required()`
3. Menggunakan `rule()` dan `rules()`
4. Menerapkan validasi unique
5. Membuat custom validation message
6. Memahami integrasi validasi Filament dengan validasi Laravel

Framework yang digunakan:

Filament

A. Review Pertemuan Sebelumnya

Pada pertemuan sebelumnya kita telah:

- Membuat Resource Post
- Mendesain layout form menggunakan Section & Group
- Mengatur tampilan form agar lebih profesional

Namun, form tersebut belum memiliki validasi input.

B. Konsep Validasi di Filament

Filament menggunakan sistem validasi dari:

Laravel

Artinya:

- Semua aturan validasi Laravel dapat digunakan
 - Validasi dapat langsung diterapkan pada komponen form
-

✦ C. Cara Menambahkan Validasi

Buka file:

- **PostForm.php**

◆ 1. Menggunakan Method `required()`

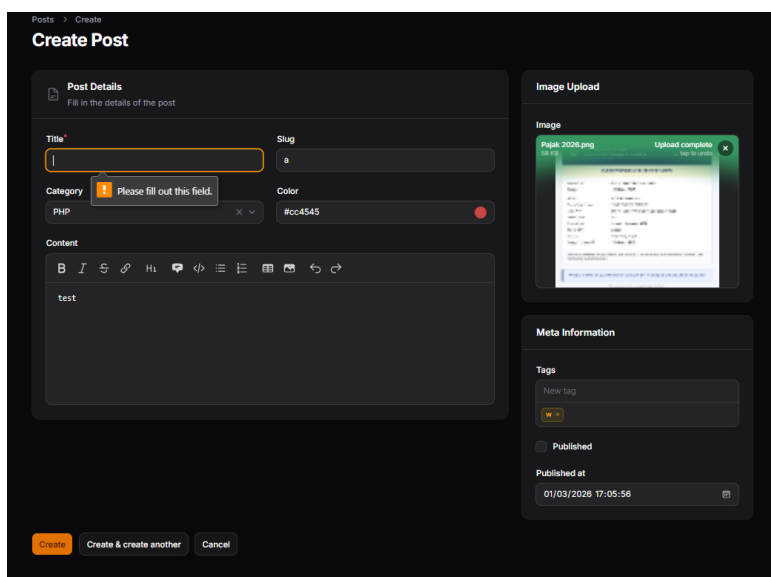

Cara paling sederhana:

- `TextInput::make('title')`
 `->required(),`

```
PraktikumPWL > app > Filament > Admin > Resources > Posts > Schemas > PostForm.php
20 {
22     {
23         return $schema
24         ->components([
30             ->schema([
31                 //grouping fields into 2 columns
32                 Group::make([
33                     TextInput::make("title")
34                     ->required()
35                     ->maxLength(255),
36                     TextInput::make("slug"),
37                     Select::make("category_id")
38                     ->relationship("category", "name")
39                     ->preload()
40                     ->searchable(),
41                     ColorPicker::make("color"),
42                 ])->columns(2),
43     ])
```

Hasil:

- Tanda (*) merah muncul
- Jika kosong → muncul pesan error otomatis

◆ 2. Menggunakan rule()

Untuk satu aturan:

- `TextInput::make('title')`
 `->rule('required'),`

```
PraktikumPWL > app > Filament > Admin > Resources > Posts > Schemas > PostForm.php
20 {
21     {
22         return $schema
23     }
24     ->components([
25         //section 1 - post details
26         Section::make("Post Details")
27         -> description("Fill in the details of the post")
28         // -> icon(Heroicon::RocketLaunch)
29         -> icon('heroicon-o-document-text')
30         ->schema([
31             //grouping fields into 2 columns
32             Group::make([
33                 TextInput::make("title")
34                 ->rules('required'),
35                 // ->rules('required | min:3 | max:10'),
36                 TextInput::make("slug"),
37                 Select::make("category_id")
38             ])
39         ])
40     })
41 }
```

◆ 3. Menggunakan rules() (Multiple Validation)

Jika ingin lebih dari satu aturan:

✓ Format String (Pipe)

```
TextInput::make('title')
->rules('required|min:3|max:50'),
```

```

20 {
21     {
22         return $schema
23     }
24     ->components([
25         //section 1 - post details
26         Section::make("Post Details")
27         -> description("Fill in the details of the post")
28         // -> icon(Heroicon::RocketLaunch)
29         -> icon('heroicon-o-document-text')
30     ])
31     ->schema([
32         //grouping fields into 2 columns
33         Group::make([
34             TextInput::make("title")
35             ->rules('required | min:3 | max:10'),
36             TextInput::make("slug"),
37             Select::make("category_id")
38             ->relationship("category", "name")
39             ->preload()
40             ->searchable(),
41             ColorPicker::make("color"),
42         ])
43     ])
44     ->columns(2),
45 }

```

✓ Format Array

- `TextInput::make('title')`
`->rules([`
 `'required',`
 `'min:3',`
 `'max:50',`
`]),`

```

20 {
21     {
22         return $schema
23     }
24     ->components([
25         //section 1 - post details
26         Section::make("Post Details")
27         -> description("Fill in the details of the post")
28         // -> icon(Heroicon::RocketLaunch)
29         -> icon('heroicon-o-document-text')
30     ])
31     ->schema([
32         //grouping fields into 2 columns
33         Group::make([
34             TextInput::make("title")
35             // ->rules("required|max:3")
36             ->rules(["required", "min:3", "max:10"]),
37             TextInput::make("slug"),
38             Select::make("category_id")
39             ->relationship("category", "name")
40             ->preload()
41             ->searchable(),
42             ColorPicker::make("color"),
43         ])
44     ])
45     ->columns(2),
46 }

```

Hasilnya sbb

◆ Contoh Pengujian

Masukkan:

- ab

Hasil:

- The title field must be at least 3 characters.

D. Validasi Unique

Untuk field slug:

- `TextInput::make('slug')`
 - >`required()`
 - >`unique()`,

PostForm.php U X

PraktikumPWL > app > Filament > Admin > Resources > Posts > Schemas > PostForm.php

```

20 {
21   {
22     return $schema
23     ->components([
24       //section 1 - post details
25       Section::make("Post Details")
26       -> description("Fill in the details of the post")
27       // -> icon(Heroicon::RocketLaunch)
28       -> icon('heroicon-o-document-text')
29       ->schema([
30         //grouping fields into 2 columns
31         Group::make([
32           TextInput::make("title")
33           ->rules('required'),
34           // ->rules('required | min:3 | max:10'),
35           TextInput::make("slug")
36           ->rules('required')
37           ->unique(),
38

```

Hasil:

- Jika slug sudah ada → muncul error
- Saat edit data → tidak error untuk data yang sama

◆ Ilustrasi Validasi Error Contoh

📌 E. Mengganti Pesan Error (Custom Message)

Untuk mengganti pesan validasi:

- `TextInput::make('slug')`
 - `->required()`
 - `->unique()`
 - `->validationMessages([`
 - `'unique' => 'Slug harus unik dan tidak boleh sama.'``]),`

```

PostForm.php U x
PraktikumPWL > app > Filament > Admin > Resources > Posts > Schemas > PostForm.php
21 {
22 {
23     return $schema
24     ->components([
25         ->icon('heroicon-o-document-text')
26         ->schema([
27             //grouping fields into 2 columns
28             Group::make([
29                 TextInput::make("title")
30                 ->rules('required'),
31                 // ->rules('required | min:3 | max:10'),
32                 TextInput::make("slug")
33                 ->rules('required')
34                 ->unique()
35                 ->validationMessages([
36                     "unique" => "Slug must be unique"
37                 ]),
38                 Select::make("category_id")
39                 ->relationship("category", "name")
40                 ->preload()
41                 ->searchable(),
42                 ColorPicker::make("color"),
43             ])->columns(2),

```

Hasil:

Pesan default diganti dengan pesan custom.

F. Contoh Validasi Lengkap Post

TextInput::make('title')

->required()

->rules('min:3|max:100'),

TextInput::make('slug')

->required()

->unique()

->validationMessages([
 'unique' => 'Slug harus unik.',
]),

Select::make('category_id')

->required(),

FileUpload::make('image')

->required(),

```
24     return $schema
25     ->components([
26         //section 1 - post details
27         Section::make("Post Details")
28         -> description("Fill in the details of the post")
29         // -> icon(Heroicon::RocketLaunch)
30         -> icon('heroicon-o-document-text')
31         ->schema([
32             //grouping fields into 2 columns
33             Group::make([
34                 TextInput::make("title")
35                 ->rules('required | min:3 | max:10'),
36                 TextInput::make("slug")
37                 ->rules('required')
38                 ->unique()
39                 ->validationMessages([
40                     "unique" => "Slug must be unique"
41                 ]),
42                 Select::make("category_id")
43                 ->relationship("category", "name")
44                 ->required()
45                 ->preload()
46                 ->searchable(),
47                 ColorPicker::make("color"),
48             ])->columns(2),
49             MarkdownEditor::make("content"),
50             ])->columnSpan(2),
51         //Grouping fields into 2 columns
52         Group::make([
53             //section 2 - image
54             Section::make("Image Upload")
55             ->schema([
56                 FileUpload::make("image")
57                 ->required()
58                 ->disk("public")
59                 ->directory("posts"),
60             ]),
61         ]),
62     ]),
63 }
```

G. Jenis Validasi yang Bisa Digunakan

Karena berbasis Laravel, kita bisa menggunakan:

Rule	Fungsi
required	Wajib diisi
min	Minimal karakter
max	Maksimal karakter
email	Format email
numeric	Hanya angka
boolean	True/False
unique	Tidak boleh duplikat
date	Format tanggal
after	Tanggal setelah
confirmed	Konfirmasi password

Dokumentasi lengkap tersedia di [Laravel Validation](#).

H. Perbedaan rule() vs required()

Method	Keterangan
required()	Shortcut validasi wajib isi
rule()	Untuk 1 rule saja
rules()	Untuk banyak rule
validationMessages()	Mengubah pesan error

I. Hasil yang Diharapkan

Mahasiswa berhasil:

- ✓ Menambahkan validasi required
- ✓ Menggunakan multiple validation
- ✓ Menggunakan unique validation
- ✓ Mengubah pesan error
- ✓ Menguji error saat input tidak valid

J. Latihan Praktikum

1. Tambahkan validasi:
 - Title minimal 5 karakter
 - Slug unik & minimal 3 karakter
 - Category wajib dipilih
 - Image wajib diupload
2. Uji semua validasi dengan input salah
3. Buat custom message minimal untuk 2 field
4. Screenshot:
 - Error required
 - Error min length
 - Error unique

K. Analisis & Diskusi

1. Mengapa validasi penting pada admin panel?
2. Apa perbedaan validasi client-side dan server-side?
3. Mengapa unique otomatis bekerja saat edit data?
4. Kapan kita perlu menggunakan rules array dibanding string?

L. Kesimpulan

Pada pertemuan ini mahasiswa telah mempelajari:

- Implementasi validasi pada Filament
- Integrasi validasi Laravel
- Validasi unik (unique)
- Custom error message
- Pengujian error input
